

# QUALITATIVE AND QUANTITATIVE

## What are we talking about?

This document does not attempt to present the definitive definitions of quantitative and qualitative data, instead the main ideas are presented in order that you can see the key differences between these two forms of data. Note that there are numerous similarities between these two methods.

	Quantitative	Qualitative
<b>General framework</b>	To confirm hypothesis about phenomena	To explore phenomena
	Instruments use more rigid style of eliciting and categorizing responses to questions	Instruments use more flexible, iterative style of eliciting and categorizing responses to questions
	Use highly structured methods such as questionnaires, surveys, and structured observation	Use semi-structured methods such as in-depth interviews, focus groups, and participant observation
<b>Analytical objectives</b>	To quantify variation (i.e., count)	To describe variation
	To predict causal relationships	To describe and explain relationships
	To describe characteristics of a population	To describe individual experiences and group norms
<b>Question format</b>	Closed-ended	Open-ended
<b>Data format</b>	Numerical (obtained by assigning numerical values to responses)	Obtained by developing themes that summarize the experience or understanding of the participants
<b>Flexibility in study design</b>	Study design is stable from beginning to end	Some aspects of the study are flexible (for example, the addition, exclusion, or wording of particular interview questions)
	Participant responses do not influence or determine how / which questions researchers ask next	Participant responses affect how and which questions researchers ask next
	Study design is subject to statistical assumptions and conditions	Study design is iterative, that is, data collection and research questions may be modified according to what is learned
